PROFILE

Biotechnology, with a computational direction

An early-career student profile focused on learning, scientific curiosity and building practical skills.

I am pursuing a B.Tech in Biotechnology at Lovely Professional University. I am especially interested in the connection between biology and computing—how genetic information, molecular mechanisms and biological datasets can be studied to better understand human disease. My current priority is to strengthen my scientific foundations, learn relevant computational tools and gradually build a portfolio of honest, well-documented academic work.

01 / CAREER INTEREST

Bioinformatics, computational biology and data-informed biomedical research.

02 / LEARNING STAGE

Beginner. Building core knowledge and technical confidence.

03 / APPROACH

Curious, evidence-led learning with a focus on clear scientific communication.

AT A GLANCE

What I am building toward

- **Biological foundation:** strengthen understanding of biotechnology, molecular biology and genetics through coursework.
- **Computational foundation:** progress from beginner concepts toward programming, biological databases and sequence-analysis tools.
- **Research practice:** learn to read scientific literature, record sources accurately and explain findings clearly.

This CV reflects my current student stage. Skills, projects and credentials will be added as they are genuinely developed.

01 / EDUCATION & DIRECTION

Academic background

Formal education and the scientific areas I want to explore during my degree.

Bachelor of Technology (B.Tech) in Biotechnology

Lovely Professional University, Punjab, India | 2026–2030 (expected)

Class XII	Class X
Jeewan Public School CBSE · 2023 **80%**	Jeewan Public School CBSE · 2021 **82%**

02 / AREAS OF INTEREST

Where biology meets computation

BIOINFORMATICS

Using computational methods to organise and interpret biological information.

MOLECULAR GENETICS

Understanding genes, genetic variation and molecular mechanisms of disease.

BIOMEDICAL RESEARCH

Learning how evidence from experiments and published studies informs disease research.

BIOLOGICAL DATA

Developing the foundations needed to explore sequences and gene-expression datasets.

AI IN HEALTHCARE

Exploring responsible applications of data-driven methods in biology and medicine.

SCIENTIFIC COMMUNICATION

Practising clear explanations of scientific concepts and research findings.

03 / ACADEMIC RESEARCH EXPOSURE

Pheochromocytoma: molecular pathogenesis and genetic basis

Academic research assignment — include as current or completed work only if accurate.

Pheochromocytoma is a rare tumour arising from chromaffin cells, often associated with catecholamine production. The topic provides an opportunity to study how genetic changes and disrupted cellular signalling can contribute to disease development.

Learning focus

- Reviewing the relationship between genetic alterations and tumour development.
- Connecting molecular biology and genetics concepts to a disease-focused question.
- Learning to organise scientific information and communicate it in an academic context.

This entry describes the topic and learning focus; it does not claim laboratory work, original findings or publication.

04 / SKILLS & LEARNING

A foundation in progress

Skills are described conservatively to reflect a beginner profile rather than overstate experience.

Biotechnology and science

- Developing foundational knowledge of biotechnology, molecular biology and genetics through undergraduate study.
- Learning to connect biological concepts with disease-focused research questions.

Research and communication

- Academic information gathering and introductory scientific literature reading.
- Organising notes and presenting scientific concepts in clear language.
- Building awareness of evidence quality, source attribution and responsible scientific communication.

Computational skills

Current level: beginner / still learning. Specific programming languages, databases, software and bioinformatics tools are intentionally not listed until they can be accurately verified.

05 / DEVELOPMENT ROADMAP

Turning interest into practical ability

A realistic progression for a student entering bioinformatics and computational biology.

STAGE 1	**Build the basics** Strengthen cell biology, genetics, molecular biology and statistics foundations.
STAGE 2	**Learn a first toolset** Practise beginner programming and learn how to navigate reputable biological databases.
STAGE 3	**Complete a small project** Choose a public dataset or sequence, document the method, cite sources and explain limitations.
STAGE 4	**Publish evidence of learning** Create a readable project report and, when appropriate, share code and documentation on GitHub.

06 / PROJECT DIRECTION

Potential beginner projects

These are future project ideas, not completed projects or claimed experience.

Biological sequence exploration

Learn to retrieve a public nucleotide or protein sequence, identify its source and practise a basic sequence search using an established resource.

Disease-focused literature review

Summarise a focused biomedical question from reliable papers, record citations and distinguish established evidence from open questions.

Gene-expression data exploration

After learning the prerequisites, explore a public dataset and practise reading metadata, making simple visualisations and describing limitations.

Project status: not represented as completed. Add each project to the CV only after performing the work and saving a report or reproducible record.

07 / PROFESSIONAL PROFILE

Learning in public, one step at a time

A student portfolio should make it easy to verify work—not just describe ambition.

GitHub

github.com/priteshmishra

Use this profile to share code, project reports, source references and clear README files as genuine work becomes available.

LinkedIn

linkedin.com/in/pritesh-kumar-mishra-4b109a373

Use this profile for education updates, relevant learning milestones and professional connections.

08 / CREDENTIALS & ACTIVITIES

Room for verified milestones

Certifications, workshops, seminars, competitions, volunteering and university activities can be added here as they are completed. No certification or award is claimed in this version.

> **DETAILS TO ADD WHEN AVAILABLE**
